

Each time a user attaches a file in Sametime, MKZip transparently and automatically compresses this file into a Zip file, reducing its size by 25% to 80% or even more. Attached files are thus exchanged at light speed between Sametime users.

Since attached files are responsible for up to 95% of the Sametime traffic (and thus storage), MKZip reduces your needs for Sametime related network bandwidth and disk space in incredible proportions.

MKZip

For IBM Lotus Sametime

Automatic and transparent Zip compression and decompression for Lotus Sametime attached files

MKZip for IBM Lotus Sametime adds transparent Zip attached file compression and decompression features to the Sametime client.

Once MKZip for Sametime is installed, the files attached by the users to their Sametime IM messages get automatically and transparently compressed into Zip files, saving huge amounts of network bandwidth and disk space.

Zip compression of the attached files occurs on the fly, automatically and transparently on the client computers, before the files are attached to the Sametime IM messages. There is nothing to install on your Sametime servers.

MKZip also provides fully integrated automatic and transparent decompression of Zip files received in Sametime, on opening and saving.

By drastically reducing the size of your Sametime IM attached files, MKZip crunches your Sametime operating costs while boosting the global performance and reactivity of your Sametime organization.

MKZip for Sametime benefits from the multi-year experience of MK Net.Work in providing advanced email compression solutions (more than 5 Million ZipMail users):

Most of the ZipMail Client parameters (including more than 110 configurable options) have been ported into MKZip for Sametime. Even better, if ZipMail Client for Lotus Note is installed on your computer, MKZip can automatically read the ZipMail parameters for its own configuration!

No user training required:

Attach your files to Sametime as usual; simply hit the Sametime paperclip button, your selected files get instantly Zipped before being attached to your Sametime IM. All is 100% automatic and transparent, no additional action is required.

Transparent and instant Zip decompression is also included!

Extensive support of Drag & Drop:

Sametime does not natively support drag and drop of files to attach. With MKZip, you can drag and drop files and folders on your Sametime IM, they all get instantly compressed by MKZip into a Zip file that is attached automatically to your IM!

Standard Zip and AES Encryption and Decryption:

MKZip provides the full support of the Zip standard encryption and of the AES (AES 128, AES 192 and AES 256) encryption. MKZip can be configured to display a password field in the attached file selection dialog of Sametime client, enabling the users to optionally password-protect and encrypt their attached compressed Zip files. Password rules can be defined to reinforce password strength.

When opening a Zip encrypted attached file (whatever is its encryption type), the MKZip transparent decompression feature displays a dialog enabling the user to enter the Zip file password. Access to the encrypted Zip file is granted only if the right password is provided.

MKZip additional security features:

MKZip also includes additional security features to protect your users against attaching and/or executing or opening unsafe or non-professional Sametime attached files (compressed or not) like exe, com, bat, mp3, avi, etc. You can define your own list of unsafe or non-professional file types.

MKZip for Sametime is a product of MK Net.Work, For more information on MKZip, and our other Lotus Notes, iNotes, Domino and Quickr optimization software: www.mknetwork.com
